

FRACES Y PARRAFOS DE COMO EMPEZAR UN PAPAN

1. Nowadays, digital traces are omnipresent in Information System (IS). Companies track IS interactions to retrieve and compile information about actors. Researchers of various streams, within IT and beyond, focused on recording actor interactions with systems and the technical possibilities to identify record and store these interactions.
2. Web services are an emerging technology to implement and integrate business processes within and across enterprises. Service orientation can be used to decompose complex systems into loosely coupled software components that may run remotely
3. Process mining techniques attempt to extract nontrivial and useful information from event logs. For example, there are many process mining techniques to automatically discover a process model describing the causal dependencies between activities
4. Process mining is originated from the fact that the modern information systems systematically record and maintain history of the process which they monitor and support. Systematic study of the recorded information in process centric manner will help to understand the process in a better way
5. In order to do process mining better in the Business Intelligence environment, the proper processmining model and the right evaluation method to assess the mining results become the key issues.
6. The growing interest in process mining is fueled by the increasing availability of event data. Processmining techniques use event logs to automatically discover process models, check conformance, identify bottlenecks and deviations, suggest improvements, and predict processing times.
7. Semi-structured processes are data-driven, human-centric, flexible processes whose execution between instances can vary dramatically
8. Process mining is an emerging discipline providing comprehensive sets of tools to provide fact-based insights and to support process improvements. This new discipline builds on process model-driven approaches and data mining.
9. Operational processes leave trails in the information systems supporting them. Such event data are the starting point for process mining - an emerging scientific discipline relating modeled and observed behavior

10. The process of student registration in IT Telkom needs to be evaluated to enable the continual improvements
